**Genre Recognition by New Music Information and Provide Personal Playlist**

- Introduction: explain the problem and the overall approach.
    - Inspired by Spotify's Made for You Function to recommend User's Daily Mix Playlist

    - We aim to optimize playlist recommendation solutions by music features, such as
        - Acousticness
        - Danceability
        - Energy
        - Instrumentalness
        - symbolic melodic similarity
- Problem statement: Nowadays, people intend to listen to songs with similar music styles. Instead of publishing new albums, singers prefer to drop single songs, and therefore, the user could not easily find potential favorite songs by searching singers or albums. We're about to give them a brand-new way of recommendation system that can meet their needs.
- Approach: describe the methods the group intends to apply to solve the problem.
- Preliminary results: state and evaluate your individual results.
